Representativeness of the results

Target of the sample were parents (stepparents/guardians) of children 6-17 years-of-age in each of the EU27 Member States.

Sizes of the sample

In most EU countries the target sample size was 500 respondents (in Cyprus, Malta and Luxembourg, the target was 250 interviews), the table below shows the achieved sample size by country.

We applied a weighting factor to the national results in order to compute a marginal total where each country contributes to the European Union result in proportion to its population.

Due to absence of systematic information regarding the parents population, a nonresponse weighting (e.g. controlling for specific socio-demographic parameters such as age, sex, etc.) was not carried out

in the sample. However, for calculating average figures for multiple countries (most notably the overall average for the EU), a weight factor was assigned to each country in the proportion of the total Eurobarometer population.

The table below presents, for each of the countries:

- (1) the number of interviews actually carried out in each country
- (2) the population-weighted total number of interviews for each country

Questionnaires

1. The questionnaire prepared for this survey is reproduced at the end of this results volume, in English (see hereafter).
2. The institutes listed above translated the questionnaire in their respective national language(s).

Sampling error

The results in a survey are valid only between the limits of a statistical margin caused by the sampling process. This margin varies with three factors:

1. The sample size (or the size of the analysed part in the sample): the greater the number of respondents is, the smaller the statistical margin will be;
2. The result in itself: the closer the result approaches 50%, the wider the statistical margin will be;
3. The desired degree of confidence: the more "strict" we are, the wider the statistical margin will be.

As an example, examine this illustrative case:

1. One question has been answered by 500 people;
2. The analysed result is around 50%;
3. We choose a significance level of 95 % (it is the level most often used by the statisticians, and it is the one chosen for the Table hereafter);

In this illustrative case the statistical margin is: (+/- 4.4%) around the observed 50%. And as a conclusion: the result for the whole population lies between 45.6% and 54.4 %.

Hereafter, the statistical margins computed for various observed results are shown, on various sample sizes, at the 95% significance level.

STATISTICAL MARGINS DUE TO THE SAMPLING PROCESS (AT THE 95 % LEVEL OF CONFIDENCE)

ARCHIVE INFORMATION AND ERRATA

- UNIQID: Original case identification is not available. A unique serial id was appointed by the archive.
- REGION: Official NUTS classification in this variable has been specified by the archive in accordance with the corresponding official NUTS classification, former Flash EB waves, and the technical report. The 13 categories for GREECE could not be clearly specified in accordance with NUTS 2, except for Attica (6022). The four NUTS1 categories were reconstructed by the archive based on the corresponding frequency distribution documented in the technical evaluation report and in accordance with former waves. Category '10050' for ITALY is not documented and implausible (representing about 30% of the Italian cases). Variable NUTS1 also recodes NUTS1 levels for Belgium and the Netherlands.
